## 1H-IMIDAZOQUINOLINE DERIVATIVES AS PROTEIN KINASE INHIBITORS

Background of the Invention

The invention relates to the use of imidazoquinolines and salts thereof in the treatment of protein kinase dependent diseases and for the manufacture of pharmaceutical preparations for the treatment of said diseases; imidazoquinolines for use in the treatment of protein kinase dependent diseases; a method of treatment against said diseases, comprising administering the imidazoquinolines to a warm-blooded animal, especially a human; pharmaceutical preparations comprising an imidazoquinoline, especially for the treatment of a protein kinase dependent disease; novel imidazoquinolines; and a process for the preparation of the novel imidazoquinolines.

Summary of the Invention

Recently, the concept of treating proliferative diseases by using drugs designed specifically against abnormally active protein kinases has been definitely proven in the treatment of chronic myeloid leukemia (CML) where a first product has now been approved for successful treatment. Clinical studies showed that the drug (*N*-{5-[4-(4-methyl-piperazino-methyl)-benzoylamido]-2-methylphenyl}-4-(3-pyridyl)-2-pyrimidine-amine, especially in the form of the methane sulfonate (monomesylate) salt called STI571, which is sold, e.g., under the tradename Gleevec®, has impressive activity against chronic phase CML. Typical for CML is a characteristic t(9;22) translocation that juxtaposes the 5' end of the bcr gene with the 3' end of the abl gene, resulting in a unique 210 kDa fusion protein p210<sup>bcr/abl</sup> with constitutive activity. The result is a p210<sup>bcr/abl</sup>-induced transformation ultimately leading to CML. STI571 is a reversible inhibitor that occupies the ATP binding pocket of p210<sup>bcr/abl</sup> and stabilizes the kinase in an inactive conformation. This inhibitory action appears to be the basis for its action against CML.

Over-expression or constitutive-expression (activity) of protein kinases appears to be a general principle for transformations that finally lead to proliferative growth of cells and thus cancer, psoriasis or other proliferative diseases. Protein kinase B (PKB), also known as Akt, is a member of a conserved family of kinases that includes PKB $\alpha$ , PKB $\beta$  and PKB $\gamma$  in humans. This serine/threonine kinase mediates the physiological effects of several peptide growth factors, including platelet-derived growth factor, insulin and insulin-like growth factor-I.

- 2 -

PKB contains a pleckstrin homology (PH) domain in its amino-terminal domain, a kinase domain in the middle and a regulatory domain in the carboxy-terminal region. The binding of phosphoinositides to the PH domain of PKB recruits PKB to the plasma membrane where it is phosphorylated on threonine-308 (Thr308) and on serine-473 (Ser473). Activation of the PKB pathways results in cellular proliferative, as well as antiapoptotic tumor cell responses. PKB $\alpha$  is amplified in 20% of gastric adenocarcinoma and PKB $\alpha$  is amplified in 15% of ovarian cancers, 12% of pancreatic cancers and 3% of breast carcinomas. PKB $\alpha$  expression and activity is elevated in estrogen receptor negative breast cancer cells and in androgen-independent prostate cancer.

The tumor suppressor protein PTEN is a lipid phosphatase that converts PIP3 into PIP2, and therefore down-regulates all pathways that are PIP3 dependent. See Cantley et al., *Proc Natl. Acad Sci USA*, Vol. 96, pp. 4240-4245 (1999); Vazquez et al., *Biochimica et Biophysica Acta*, Vol. 1470, pp. M21-M35 (2000); and Simpson et al., *Exper Cell Res*, Vol. 264, pp. 29-41 (2001). The PTEN tumor suppressor gene is frequently found mutated or deleted in glioblastoma [see Li et al., *Science*, Vol. 275, pp. 1943-1947 (1997); and Steck et al., *Nat Genetics*, Vol. 15, pp. 356-362 (1997)], endometrial carcinoma [see Nagase et al., *Br J Cancer*, Vol. 74, pp. 1979-1983 (1996)]; Peiffer et al., *Cancer Res*, Vol. 55, pp. 1922-1926 (1995), prostate adenocarcinoma [see Gray et al., *Cancer Res*, Vol. 55, No. 21, pp. 4800-4803 (1995); and Ittmann, *Cancer Res*, Vol. 56, pp. 2143-2147 (1996)], breast adenocarcinoma [see Perren et al., *Am J Pathol*, Vol. 155, No. 4, pp. 1253-1260 (1999)] and melanoma. See Robertson et al., *Cancer Res*, Vol. 59, No. 15, pp. 3596-3601 (1999). PTEN mutations have also been found in cancers of the bladder, lung and lymphatic systems. See Cairns et al., *Oncogene*, Vol. 16, pp. 3215-3218 (1998); Gronbaek et al., *Blood*, Vol. 91, pp. 4388-4390 (1998); and Kim et al., *Oncogene*, Vol. 16, pp. 89-93 (1998). Tumor cell lines with an inactive PTEN allele exhibit elevated PKB kinase activity. See Haas-Kogan et al., *Curr Biol*, Vol. 8, pp. 1195-1198 (1998); Whang et al., *Proc Natl Acad Sci USA*, Vol. 95, pp. 5246-5250 (1998); and Wu et al., *Proc Natl Acad Sci USA*, Vol. 95, pp. 15587-15591 (1998). Consequently, mutations in PTEN that inactivate its lipid phosphatase function allow unregulated PKB activity, a major player in the PI-3K pathway, leading to uncontrolled cell proliferation and increased survival.

Germline mutations of PTEN are also associated to Cowden syndrome, Lhermitte-Dudon disease and Bannayan-Zonana syndrome. See Maehama and Dixon, *Trends Cell Biol*, Vol. 9, pp. 125-128 (1990). Therefore, compounds that down-regulate the kinase activity of PKB may prove to be of clinical interest for single and combined anticancer treatment modalities.

S6K1, also known as p70 S6 kinase is a serine/threonine kinase that phosphorylates the ribosomal protein S6 (rpS6) in response to mitogen stimulation. Phosphorylation of rpS6 leads to increased expression of the mRNA family members characterized by an oligopyrimidine tract at their 5' transcriptional start sites (5'TOP) and results in upregulation of protein synthesis because the 5'TOP family mRNAs encode components of the translational apparatus including ribosomal proteins and translational elongation factors. S6K1-deficient mice are protected against diet-induced weight gain and insulin resistance due to the increase in energy expenditure and fatty acid metabolism, suggesting that S6K1 is a potential target of metabolic diseases, e.g., type II diabetes, obesity, hyperlipidemia and atherosclerosis.

The compounds of the present invention also exhibit powerful inhibition of the tyrosine kinase activity of anaplastic lymphoma kinase (ALK) and the fusion protein of NPM-ALK. This protein tyrosine kinase results from a gene fusion of nucleophosmin (NPM) and the anaplastic lymphoma kinase (ALK), rendering the protein tyrosine kinase activity of ALK ligand-independent. NPM-ALK plays a key role in signal transmission in a number of hematopoietic and other human cells leading to hematological and neoplastic diseases, for example in anaplastic large-cell lymphoma (ALCL) and non-Hodgkin's lymphomas (NHL), specifically in ALK+ NHL or ALKomas, in inflammatory myofibroblastic tumors (IMT) and neuroblastomas. See Duyster et al., *Oncogene*, Vol. 20, pp. 5623-5637 (2001). In addition to NPM-ALK, other gene fusions have been identified in human hematological and neoplastic diseases; mainly TPM3-ALK (a fusion of nonmuscle tropomyosin with ALK).

RET encodes a transmembrane receptor of the protein tyrosine kinase family. RET is the receptor of growth factors belonging to the glial cell line-derived neurotrophic factor (GDNF) family. This family is comprised of the GDNF, neurturin (NTN), persephin (PSP), and artemin, which all have trophic influences on a variety of neuronal populations. These ligands interact with multimeric receptors composed of high-affinity glycosyl-phosphatidylinositol (GPI)-linked receptors and the RET kinase. Ligand-dependent RET activation can promote neuronal cell survival and differentiation. Insufficient PTK signaling

- 4 -

may be responsible for developmental diseases. Gain of function of the RET receptor PTK is associated with human cancer.

What is desirable from the point of view of possible treatments of proliferative diseases is to have a plethora of compound classes each tailored to specific protein kinases or protein kinase classes, thus allowing to come to specific treatments. Therefore, a strong need exists to find new classes of compounds allowing for such specific inhibitory effects.

## **Summary of the Invention**

The class of imidazoquinoline compounds described herein, especially novel compounds falling under this class, has surprisingly been found to have pharmaceutically advantageous properties, *inter alia*, allowing for the inhibition of specific types or classes or groups of protein kinases, especially PKB, ALK, RET, S6K1 or any combinations of two or more of these. The class of imidazoquinoline compounds described herein further inhibit mutants of said kinases. In addition to this established activity, the imidazoquinolines have the advantage that their backbone in addition allows for a plethora of substitution patterns that offer a broad possibility to achieve a fine tuning for specific interaction with the ATP-binding site of the kinases, thus opening a new perspective and providing kinase inhibitors of various degrees of specificity.

*m* is 0 or 1; and

R<sub>8</sub> and R<sub>9</sub> can be the same or different and are independently H; lower alkyl, e.g., methyl, ethyl or propyl; lower cycloalkyl, e.g., cyclopropyl, or

R<sub>8</sub> and R<sub>9</sub>, together with the N atom, form a 3- to 8-membered heterocyclic ring containing 1-4 nitrogen, oxygen or sulfur atoms, e.g., azetidinyl, pyrrolidinyl, piperidino, morpholinyl, imidazolinyl, piperazinyl or lower alkyl-piperazinyl.

"Substituted" also includes amino-carbonyl-lower alkyl, e.g., R<sub>8</sub>R<sub>9</sub>-N-C(O)-CH<sub>2</sub>-, wherein R<sub>8</sub> and R<sub>9</sub> are as defined above; heterocyclyl; heterocyclyl-lower alkyl; heterocyclyl-lower alkoxy or heterocyclyl-lower alkanesulfonyl, wherein the heterocyclyl is a substituted or

It goes without saying that substituents are only at positions where they are chemically possible, the person skilled in the art being able to decide (either experimentally or theoretically) without inappropriate effort which substitutions are possible and which are not. For example, amino or hydroxy groups with free hydrogen may be unstable if bound to carbon atoms with unsaturated, e.g., olefinic, bonds.

Salts are preferably the pharmaceutically acceptable salts of compounds of formula (I) if they are carrying salt-forming groups.

Salt-forming groups in a compound of formula (I) are groups or radicals having basic or acidic properties. Compounds having at least one basic group or at least one basic radical, e.g., amino; a secondary amino group not forming a peptide bond or a pyridyl radical, may form acid addition salts, e.g., with inorganic acids, such as hydrochloric acid, sulfuric acid or a phosphoric acid; or with suitable organic carboxylic or sulfonic acids, e.g., aliphatic mono- or di-carboxylic acids, such as trifluoroacetic acid, acetic acid, propionic acid, glycolic acid, succinic acid, maleic acid, fumaric acid, hydroxymaleic acid, malic acid, tartaric acid, citric acid or oxalic acid; or amino acids, such as arginine or lysine; aromatic carboxylic acids, such as benzoic acid; 2-phenoxy-benzoic acid; 2-acetoxy-benzoic acid; salicylic acid; 4-aminosalicylic acid; aromatic-aliphatic carboxylic acids, such as mandelic acid or cinnamic acid; heteroaromatic carboxylic acids, such as nicotinic acid or isonicotinic acid; aliphatic sulfonic acids, such as methane-, ethane- or 2-hydroxyethanesulfonic acid; or aromatic sulfonic acids, e.g., benzene-, p-toluene- or naphthalene-2-sulfonic acid. When several basic groups are present mono- or poly-acid addition salts may be formed.

Compounds of formula (I) having acidic groups, a carboxy group or a phenolic hydroxy group, may form metal or ammonium salts, such as alkali metal or alkaline earth metal salts, e.g., sodium, potassium, magnesium or calcium salts; or ammonium salts with ammonia or suitable organic amines, such as tertiary monoamines, e.g., triethylamine or

- 12 -

tri(2-hydroxyethyl)-amine, or heterocyclic bases, e.g., *N*-ethyl-piperidine or *N,N'*-dimethylpiperazine. Mixtures of salts are possible.

Compounds of formula (I) having both acidic and basic groups can form internal salts.

For the purposes of isolation or purification, as well as in the case of compounds that are used further as intermediates, it is also possible to use pharmaceutically-unacceptable salts, e.g., the picrates. Only pharmaceutically-acceptable, non-toxic salts may be used for therapeutic purposes, however, and those salts are therefore preferred.

Owing to the close relationship between the novel compounds in free form and in the form of their salts, including those salts that can be used as intermediates, e.g., in the purification of the novel compounds or for the identification thereof, any reference hereinbefore and hereinafter to the free compounds shall be understood as including the corresponding salts, where appropriate and expedient.

Where the plural form is used for compounds, salts, pharmaceutical preparations, diseases and the like, this is intended to mean also a single compound, salt or the like.

Any asymmetric carbon atom may be present in the (R)-, (S)- or (R,S)-configuration, preferably in the (R)- or (S)-configuration. Substituents at a double bond or a ring may be present in *cis*- (=Z-) or *trans* (=E-) form. The compounds may thus be present as mixtures of isomers or preferably as pure isomers, preferably as enantiomer-pure diastereomers or pure enantiomers.

The present invention also relates to pro-drugs of a compound of formula (I) that convert *in vivo* to the compound of formula (I) as such. Any reference to a compound of formula (I) is therefore to be understood as referring also to the corresponding pro-drugs of the compound of formula (I), as appropriate and expedient.

The terms "treatment" or "therapy" refer to the prophylactic or preferably therapeutic including, but not limited to, palliative, curing, symptom-alleviating, symptom-reducing, kinase-regulating and/or kinase-inhibiting, treatment of said diseases, especially of the diseases mentioned below.

Where subsequently or above the term "use" is mentioned (as verb or noun) (relating to the use of a compound of the formula (I) or a pharmaceutically acceptable salt thereof), this includes any one or more of the following embodiments of the invention, respectively: the use in the treatment of a protein kinase dependent disease, the use for the manufacture of

pharmaceutical compositions for use in the treatment of a protein kinase dependent disease, methods of use of one or more compounds of the formula (I) in the treatment of a protein kinase dependent disease, the use of pharmaceutical preparations comprising one or more compounds of the formula (I) for the treatment of a protein kinase dependent disease, and one or more compounds of the formula (I) for use in the treatment of a protein kinase dependent disease, as appropriate and expedient and if not stated otherwise. In particular, diseases to be treated and are thus preferred for "use" of a compound of formula (I) are selected from protein kinase dependent ("dependent" meaning also "supported", not only "solely dependent") diseases mentioned herein, especially proliferative diseases mentioned herein, more especially any one or more of these or other diseases that depend on one or more of PKB, ALK, S6K1 and RET or any combinations of two or more of these, or a mutant of any one or more of these, and a compound of the formula (I) can therefore be used in the treatment of a kinase dependent disease, especially a disease depending on one or more of the kinases mentioned above and below, where (especially in the case of aberrantly highly-expressed, constitutively activated and/or mutated kinases) said kinase-dependent disease is dependent on the activity of one or more of the said kinases or the pathways they are involved.

The compounds of formula (I) have valuable pharmacological properties and are useful in the treatment of protein kinase dependent diseases, e.g., as drugs to treat proliferative diseases.

*RET kinase inhibition is determined as follows:* The baculovirus donor vector pFB-GSTX3 is used to generate a recombinant baculovirus that expresses the amino acid region 658-1072 (Swiss Prot No. Q9BTB0) of the intra-cytoplasmic kinase domain of human RET-Men2A which corresponds to the wild-type kinase domain of RET (wtRET) and RET-Men2B, which differs from the wtRET by the activating mutation in the activation loop M918T. The coding sequences for the cytoplasmic domain of wtRET and RET-Men2B are amplified by PCR from the plasmids pBABEpuro RET-Men2A and pBABEpuro RET-Men2B, respectively which are received from Dr. James Fagin, College of Medicine, University of Cincinnati. The amplified DNA fragments and the pFB-GSTX3 vector are made compatible for ligation by digestion with Sall and KpnI. Ligation of these DNA fragments results in the baculovirus donor plasmid pFB-GX3-RET-Men2A and pFB-GX3-RET-Men2B, respectively.

*Production of virus:* Transfer vectors containing the kinase domains are transfected into the DH10Bac cell line (GIBCO) and plated on selective agar plates. Colonies without insertion of the fusion sequence into the viral genome (carried by the bacteria) are blue. Single, white colonies are picked and viral DNA (bacmid) isolated from the bacteria by standard plasmid purification procedures. Sf9 cells or Sf21 (American Type Culture Collection) cells are then transfected in 25 cm<sup>2</sup> flasks with the viral DNA using Cellfectin reagent.

*Determination of small scale protein expression in Sf9 cells:* Virus-containing media is collected from the transfected cell culture and used for infection to increase its titer. Virus-containing media obtained after two rounds of infection is used for large-scale protein expression. For large-scale protein expression 100 cm<sup>2</sup> round tissue culture plates are seeded with 5 x 10<sup>7</sup> cells/plate and infected with 1 mL of virus-containing media (approximately 5 MOIs). After 3 days, the cells are scraped off the plate and centrifuged at 500 rpm for 5 minutes. Cell pellets from 10-20, 100 cm<sup>2</sup> plates, are re-suspended in 50 mL

- 20 -

of ice-cold lysis buffer (25 mM tris-HCl, pH 7.5, 2 mM EDTA, 1% NP-40, 1 mM DTT, 1 mM PMSF). The cells are stirred on ice for 15 minutes and then centrifuged at 5,000 rpm for 20 minutes.

*Purification of GST-tagged proteins:* The centrifuged cell lysate is loaded onto a 2 mL glutathione-sepharose column (Pharmacia) and washed 3 x with 10 mL of 25 mM tris-HCl, pH 7.5, 2 mM EDTA, 1 mM DTT, 200 mM NaCl. The GST-tagged proteins are then eluted by 10 applications (1 mL each) of 25 mM tris-HCl, pH 7.5, 10 mM reduced-glutathione, 100 mM NaCl, 1 mM DTT, 10% glycerol and stored at -70°C.

*Measure of enzyme activity:* Tyrosine protein kinase assays with either purified GST-wtRET or GST-RET-Men2B protein are carried out in a final volume of 30 µL containing 15 ng of either GST-wtRET or GST-RET-Men2B protein, 20 mM tris-HCl, pH 7.5, 1 mM MnCl<sub>2</sub>, 10 mM MgCl<sub>2</sub>, 1 mM DTT, 3 µg/mL poly(Glu,Tyr) 4:1, 1% dimethyl sulfoxide (DMSO), 2.0 µM ATP ( $\gamma$ -[<sup>33</sup>P]-ATP 0.1 µCi). The activity is assayed in the presence or absence of inhibitors, by measuring the incorporation of <sup>33</sup>P from [ $\gamma$ -<sup>33</sup>P] ATP into poly(Glu,Tyr) 4:1. The assay is carried out in 96-well plates at ambient temperature for 15 minutes under conditions described below and terminated by the addition of 20 µL of 125 mM EDTA. Subsequently, 40 µL of the reaction mixture are transferred onto Immobilon-PVDF membrane (Millipore) previously soaked for 5 minutes with methanol, rinsed with water, then soaked for 5 minutes with 0.5% H<sub>3</sub>PO<sub>4</sub> and mounted on vacuum manifold with disconnected vacuum source. After spotting all samples, vacuum is connected and each well-rinsed with 200 µL 0.5% H<sub>3</sub>PO<sub>4</sub>. Membranes were removed and washed 4 x on a shaker with 1.0% H<sub>3</sub>PO<sub>4</sub>, once with ethanol. Membranes are counted after drying at ambient temperature, mounting in Packard TopCount 96-well frame, and addition of 10 µL/well of Microscint TM (Packard). IC<sub>50</sub> values are calculated by linear regression analysis of the percentage inhibition of each compound in duplicate, at 4 concentrations (usually 0.01, 0.1, 1 and 10 µM). One unit of protein kinase activity is defined as 1 nmole of <sup>33</sup>P ATP transferred from [ $\gamma$ -<sup>33</sup>P] ATP to the substrate protein/minute/mg of protein at 37°C.

#### IC<sub>50</sub> calculations

input	3 x 4 µL stopped assay on Immobilon membrane, not washed
background (3 wells)	assay with H <sub>2</sub> O instead of enzyme
positive control (4 wells)	3% DMSO instead of compound
bath control (1 well)	no reaction mix

$IC_{50}$  values are calculated by logarithmic regression analysis of the percentage inhibition of each compound at 4 concentrations (usually 3- or 10-fold dilution series starting at 10  $\mu$ M). In each experiment, the actual inhibition by reference compound is used for normalization of  $IC_{50}$  values to the basis of an average value of the reference inhibitor:

$$\text{Normalized } IC_{50} = \frac{\text{measured } IC_{50} \text{ average ref. } IC_{50}}{\text{measured ref. } IC_{50}}$$

Example: Reference inhibitor in experiment 0.4  $\mu$ M, average 0.3  $\mu$ M

Test compound in experiment 1.0  $\mu$ M, normalization:  $0.3/0.4 = 0.75 \mu$ M

For example, staurosporine or a synthetic staurosporine derivative are used as reference compounds.

Using this protocol, the compounds of the formula (I) are found to show  $IC_{50}$  values for RET inhibition in the range from 0.001-20  $\mu$ M, preferably in the range from 0.01-2  $\mu$ M.

*The efficacy of the compounds of formula (I) as inhibitors of PKB kinase activity can be demonstrated as follows:* To fully activate PKB, the enzyme is exposed to catalytic amounts of PDK1. GST-PKB [100 ng, specific activity (SA): 0.2 nmole/mg/min.] is incubated for 30 minutes at room temperature (RT) with purified recombinant GST-PDK1 (1 ng, SA: 2 nmole/min./mg). The activation is performed as follows: 0.1  $\mu$ g of GST-PDK1 (0.05  $\mu$ L) and 10  $\mu$ g of GST-PKB (0.45  $\mu$ L) are mixed in a total volume of 0.75  $\mu$ L containing 15  $\mu$ M ATP, 3 mM MgCl<sub>2</sub>, 20 mM hepes (pH 7.6) for 30 minutes at RT. The reaction is subsequently stopped by adding 0.25  $\mu$ L containing 30% glycerol (w/w) and 0.06  $\mu$ L of 500 mM EDTA. 100-500 ng (0.01-0.05  $\mu$ L) activated GST-PKB is incubated in a final volume of 30  $\mu$ L with 10  $\mu$ M of the RRPRTSFS peptide, 10 mM Mg-acetate, 50 mM MOPS (pH 7.5), 1 mM DTT and 300  $\mu$ g/mL BSA, 20  $\mu$ M ATP (0.1  $\mu$ Ci  $\gamma$ -<sup>33</sup>P-ATP). The reaction is carried out for 30 minutes at RT in the presence of either 1% DMSO or the test compound of the formula (I) at the required concentration in 1% DMSO. The reaction is terminated by the addition of 20  $\mu$ L 125 mM EDTA. Thirty (30)  $\mu$ L of each sample is spotted onto P81 Whatman and the paper squares processed. See Ferrari and Thomas, *Methods Enzymol.*, Vol. 200, pp. 159-169 (1991).  $IC_{50}$  values are calculated by linear regression analysis of the percentage inhibition of each compound in duplicate.  $IC_{50}$  values for compounds of the formula (I) are in the range from 0.005-100  $\mu$ M, for preferred compounds between 0.01  $\mu$ M and 2  $\mu$ M.

*The efficacy of the compounds of formula (I) as inhibitors of S6K1 activity can be demonstrated as follows:* The DNA fragment encoding ORF of human S6K1 (+28-1605,

- 22 -

Genbank NM\_003161) is amplified from human muscle cDNA library and modified by PCR to generate a C-terminal truncated form (amino acid region 1-421) with an activating mutation of T412E, hereinafter S6K1 $\Delta$ CT/T412E. The DNA fragment encoding S6K1 $\Delta$ CT/T412E is subcloned to the baculovirus donor vector pFastBacHT A to generate a recombinant baculovirus that expresses S6K1 $\Delta$ CT/T412E. Transfer vectors for S6K1 $\Delta$ CT/T412E are transfected into the DH10Bac cell line (GIBCO). After selection of white colonies, they are used for viral DNA (bacmid) preparation. Sf9 cells (American Type Culture Collection) cells are then transfected with the viral DNA using Cellfectin reagent. Virus-containing media is collected from the transfected cell culture and is used for infection to increase its titer. For large-scale protein expression, Sf9 cells are co-infected with S6K1 $\Delta$ CT/T412E and GST-PDK1 virus-containing media with MOI of 2.25 and 1, respectively. After 3 days, the cells expressing the recombinant enzyme are resuspended in the culture medium with a sterilized cell scraper and harvested by centrifugation. The cells are resuspended in 5 volumes of cell pellet of Extraction Buffer (50 mM MOPS pH 7.0, containing 300 mM NaCl, 0.05% Tween-20, 10 mM sodium pyrophosphate, 50 mM  $\beta$ -glycerophosphate, 0.2 mM cantharidic acid and 1 x complete-EDTA protease inhibitor cocktail) and then disrupted with 15 strokes of a Dounce homogenizer followed by sonication on ice. The homogenate is centrifuged at 4°C for 60 minutes at 48,000 x g. The supernatant is clarified with a 5  $\mu$ m filter and subjected to purification with TALON Superflow Resin (Clontech). First, 1 mL of TALON resin per 5 mL of the supernatant was equilibrated with the Extraction Buffer and resuspended in the supernatant followed by gentle agitation for 20 minutes at RT. After centrifugation at 700 x g for 5 minutes, supernatant is removed. The resin is washed twice by adding 10 bed volumes of the Extraction Buffer, agitating for 10 minutes at RT, centrifugating at 700 x g for 5 minutes, and discarding the supernatant. The resin is then resuspended with the same volume of the Extraction Buffer and transferred to an disposable chromatography column. The packed column is washed once with 10 bed volumes of the Extraction Buffer and additionally with the same volume of Wash Buffer (5 mM imidazole in the Extraction Buffer). Then, the His-tagged S6K1 $\Delta$ CT/T412E is eluted with four bed volumes of Elution Buffer (150 mM imidazole in the Extraction Buffer).

*Measure of enzyme activity:* The kinase assay with purified S6K1 $\Delta$ CT/T412E is performed with TR-FRET (Time-Resolved Fluorescence Resonance Energy Transfer) technology. First, ATP-dependent phosphorylation of the biotinylated substrate peptide corresponding to residues 229-242 of S6 ribosomal protein (Biot-AKRRRLSSLRASTS) is carried out for 1 hour at 37°C in 382-well plates under humidified air. The kinase reaction mixture of the final volume of 9  $\mu$ L contains 2.57 ng of purified S6K1 $\Delta$ CT/T412E protein, 50 mM MOPS (pH 7.0),

0.1 mM EGTA, 0.01 mM Na<sub>3</sub>VO<sub>4</sub>, 0.05% Tween-20, 0.01% BSA, 1 mM DTT, 10 mM MgCl<sub>2</sub>, 3 µM ATP, 0.5 µM biotinylated substrate peptide, 1% of DMSO or the text compounds of the formula (I) at the required concentration in 1% DMSO. For measurement of background, 20 mM of EDTA is added to the reaction mixture. The kinase reaction is terminated by addition of 6 µL of Detection Mixture [50 mM MOPS (pH 7.0), 25 mM EGTA, 200 mM NaCl, 0.05% Tween-20, 0.01% BSA, 5 µg/mL SureLight Allophycocyanin-streptavidin (Perkin Elmer), 2 nM LANCE Eu-W1024 anti-rabbit IgG (Perkin Elmer), 0.2 µg/mL Phospho-S6 Ribosomal Protein (Ser235/236) Antibody (Cell Signaling Technology)] and the plates are incubated for 2 hours. Phosphorylated peptide indicative of kinase activity is quantitated by exciting the sample at 330 nm and comparing donor emission at 615 nm and acceptor emission at 665 nm by 2101 EnVision HTS multilabel plate reader (Perkin Elmer). The ratio of acceptor counts divided by donor counts is used as a normalized parameter for both signal and background. IC<sub>50</sub> values are calculated by linear regression analysis of the percentage inhibition of each compound in triplicate, at 7 concentrations (usually 0.01, 0.001, 0.03, 0.1, 0.3, 1 and 10 µM).

*The efficacy of the compounds of formula (I) as inhibitors of ALK tyrosine kinase activity can be demonstrated as follows:* The inhibition of ALK tyrosine kinase activity can be demonstrated using known methods, e.g., using the recombinant kinase domain of the ALK in analogy to the VEGF-R kinase assay. See Wood et al., *Cancer Res*, Vol. 60, No. 8, pp. 2178-2189 (2000). *In vitro* enzyme assays using GST-ALK protein tyrosine kinase are performed in 96-well plates as a filter binding assay in 20 mM tris-HCl, pH=7.5, 3 mM MgCl<sub>2</sub>, 10 mM MnCl<sub>2</sub>, 1 mM DTT, 0.1 µCi/assay (=30 µL) [ $\gamma$ -<sup>33</sup>P]-ATP, 2 µM ATP, 3 µg/mL poly (Glu, Tyr 4:1) Poly-EY (Sigma P-0275), 1% DMSO, 25 ng ALK enzyme. Assays are incubated for 10 minutes at ambient temperature. Reactions are terminated by adding 50 µL of 125 mM EDTA, and the reaction mixture is transferred onto a MAIP Multiscreen plate (Millipore, Bedford, MA, USA), previously wet with methanol, and re-hydrated for 5 minutes with H<sub>2</sub>O. Following washing (0.5% H<sub>3</sub>PO<sub>4</sub>), plates are counted in a liquid scintillation counter. IC<sub>50</sub> values are calculated by linear regression analysis of the percentage inhibition. Compared with the control without inhibitor, the compounds of formula (I) inhibit the enzyme activity by 50% (IC<sub>50</sub>), e.g., in a concentration of from 0.001-0.5 µM, especially from 0.1-0.8 µM.

The compounds of formula (I) that inhibit the protein kinase activities mentioned, especially tyrosine and/or the serine/threonine protein kinases mentioned above, can therefore be used in the treatment of protein kinase dependent diseases, especially diseases depending on PKB, ALK, S6K1 or RET and (especially aberrantly highly-expressed or activated) PKB, ALK,

- 24 -

S6K1 or RET-dependent disease or disease dependent on the activation of the PKB, ALK, S6K1 or RET pathways or any combination of two or more of the mentioned kinases.

Protein kinase dependent diseases are especially proliferative diseases, preferably a benign or especially malignant tumor, more preferably carcinoma of the brain, kidney, liver, adrenal gland, bladder, breast, stomach (especially gastric tumors), ovaries, colon, rectum, prostate, pancreas, lung, vagina, thyroid, sarcoma, glioblastomas, multiple myeloma or gastrointestinal cancer, especially colon carcinoma or colorectal adenoma, or a tumor of the neck and head, an epidermal hyperproliferation, especially psoriasis, prostate hyperplasia, a neoplasia, especially of epithelial character, preferably mammary carcinoma, or a leukemia, especially as far as c-Met is involved. They are able to bring about the regression of tumors and to prevent the formation of tumor metastases and the growth of (also micro)metastases. In addition, they can be used in epidermal hyperproliferation, e.g., psoriasis; in prostate hyperplasia; in the treatment of neoplasias, especially of epithelial character, e.g., mammary carcinoma; and in leukemias. It is also possible to use the compounds of formula (I) in the treatment of diseases of the immune system insofar as several or, especially, individual tyrosine protein kinases and/or (further) serine/threonine protein kinases are involved; furthermore, the compounds of formula (I) can be used also in the treatment of diseases of the central or peripheral nervous system where signal transmission by at least one tyrosine protein kinase and/or (further) serine/threonine protein kinase is involved.

There are also experiments to demonstrate the antitumor activity of compounds of the formula (I) *in vivo*.

Female Balb/c hairless mice with subcutaneously (s.c.) transplanted human bladder tumors T24 can be used to determine the anti-tumor activity. On day 0, with the animals under peroral forene narcosis, approximately 25 mg of a solid tumor are placed under the skin on the animals' left flank and the small incised wound is closed by means of suture clips. On day 6 after the transplantation, the mice are divided at random into groups of 6 animals and treatment commences. The treatment is carried out for 15 days with peroral, intravenous or intraperitoneal administration once daily (or less frequently) of a compound of formula (I) in DMSO/Tween80/sodium chloride solution in the various doses. The tumors are measured twice a week with a slide gauge and the volume of the tumors is calculated.

can be obtained by converting the corresponding compound of the formula (I), wherein R is H with a halogenide, especially iodide, such as lower alkyl iodide; in the presence of a strong base, especially an alkali metal hydride, e.g., sodium hydride; in an appropriate aprotic solvent, e.g., a *N,N*-di-lower alkyl-lower alkanoyl amide; at preferred temperatures in the range from 0-50°C, e.g., at RT, into said compound.

A compound of the formula (I),

wherein

X is C=O;

y is 1; and

R is aryl, especially phenyl,

can be obtained by converting the corresponding compound of the formula (I), wherein R is H with an arylboronic acid, especially phenylboronic acid; in the presence of anhydrous cupric acetate and a tertiary amine, e.g., a tri-lower alkylamine, such as triethylamine; in an appropriate aprotic solvent, especially a halogenated hydrocarbon, such as dichloromethylene; at preferred temperatures between 0°C and 50°C, e.g., at RT, into said compound.

Salts of compounds of formula (I) having at least one salt-forming group may be prepared in a manner known *per se*. For example, salts of compounds of formula (I) having acid groups

may be formed, e.g., by treating the compounds with metal compounds, such as alkali metal salts of suitable organic carboxylic acids, e.g., the sodium salt of 2-ethylhexanoic acid; with organic alkali metal or alkaline earth metal compounds, such as the corresponding hydroxides, carbonates or hydrogen carbonates, such as sodium or potassium hydroxide, carbonate or hydrogen carbonate; with corresponding calcium compounds or with ammonia or a suitable organic amine, stoichiometric amounts or only a small excess of the salt-forming agent preferably being used. Acid addition salts of compounds of formula (I) are obtained in customary manner, e.g., by treating the compounds with an acid or a suitable anion exchange reagent. Internal salts of compounds of formula (I) containing acid and basic salt-forming groups, e.g., a free carboxy group and a free amino group, may be formed, e.g., by the neutralization of salts, such as acid addition salts, to the isoelectric point, e.g., with weak bases, or by treatment with ion exchangers.

Salts can be converted in customary manner into the free compounds; metal and ammonium salts can be converted, e.g., by treatment with suitable acids; and acid addition salts, e.g., by treatment with a suitable basic agent.

Mixtures of isomers obtainable according to the invention can be separated in a manner known *per se* into the individual isomers; diastereoisomers can be separated, e.g., by partitioning between polyphasic solvent mixtures, recrystallization and/or chromatographic separation, e.g., over silica gel or by, e.g., medium pressure liquid chromatography over a reversed phase column; and racemates can be separated, e.g., by the formation of salts with optically pure salt-forming reagents and separation of the mixture of diastereoisomers so obtainable, e.g., by means of fractional crystallization, or by chromatography over optically active column materials.

Intermediates and final products can be worked up and/or purified according to standard methods, e.g., using chromatographic methods, distribution methods, re-crystallization and the like.

#### **Additional process steps**

In the additional process steps, carried out as desired, functional groups of the starting compounds which should not take part in the reaction may be present in unprotected form or may be protected, e.g., by one or more protecting groups. The protecting groups are then wholly or partly removed according to one of the known methods.

Protecting groups, and the manner in which they are introduced and removed are described, e.g., *Protective Groups in Organic Chemistry*, Plenum Press, London, NY (1973); *Methoden der organischen Chemie, Houben-Weyl*, 4<sup>th</sup> Edition, Vol. 15/1, Georg-Thieme-Verlag, Stuttgart (1974); and Theodora W. Greene, *Protective Groups in Organic Synthesis*, John Wiley & Sons, NY (1981). A characteristic of protecting groups is that they can be removed readily, i.e., without the occurrence of undesired secondary reactions, e.g., by solvolysis, reduction, photolysis or alternatively under physiological conditions.

The end products of formula (I) may however also contain substituents that can also be used as protecting groups in starting materials for the preparation of other end products of formula (I). Thus, within the scope of this text, only a readily removable group that is not a constituent of the particular desired end product of formula (I) is designated a "protecting group", unless the context indicates otherwise.

#### General process conditions

The following applies in general to all processes mentioned hereinbefore and hereinafter, while reaction conditions specifically mentioned above or below are preferred:

All the above-mentioned process steps can be carried out under reaction conditions that are known *per se*, preferably those mentioned specifically, in the absence or, customarily, in the presence of solvents or diluents, preferably solvents or diluents that are inert towards the reagents used and dissolve them, in the absence or presence of catalysts, condensation or neutralizing agents, e.g., ion exchangers, such as cation exchangers, e.g., in the H<sup>+</sup> form; depending on the nature of the reaction and/or of the reactants at reduced, normal or elevated temperature, e.g., in a temperature range of from about -100°C to about 190°C; preferably from approximately -80°C to approximately 150°C, e.g., at from -80°C to -60°C at RT, at from -20°C to 40°C or at reflux temperature; under atmospheric pressure or in a closed vessel, where appropriate under pressure and/or in an inert atmosphere, e.g., under an argon or nitrogen atmosphere.

At all stages of the reactions, mixtures of isomers that are formed can be separated into the individual isomers, e.g., diastereoisomers or enantiomers; or into any desired mixtures of isomers, e.g., racemates or mixtures of diastereoisomers, e.g., analogously to the methods described under "additional process steps".

The solvents from which those solvents that are suitable for any particular reaction may be selected include those mentioned specifically or, e.g., water; esters, such as lower alkyl-

lower alkanoates, e.g., ethyl acetate; ethers, such as aliphatic ethers, e.g., diethyl ether; or cyclic ethers, e.g., tetrahydrofuran or dioxane; liquid aromatic hydrocarbons, such as benzene or toluene; alcohols, such as methanol, ethanol or 1- or 2-propanol; nitriles, such as acetonitrile; halogenated hydrocarbons, such as methylene chloride or chloroform; acid amides, such as dimethylformamide or dimethyl acetamide; bases, such as heterocyclic nitrogen bases, e.g., pyridine or *N*-methylpyrrolidin-2-one; carboxylic acid anhydrides, such as lower alkanoic acid anhydrides, e.g., acetic anhydride; cyclic, linear or branched hydrocarbons, such as cyclohexane, hexane or isopentane; or mixtures of those solvents, e.g., aqueous solutions, unless otherwise indicated in the description of the processes. Such solvent mixtures may also be used in working up, e.g., by chromatography or partitioning.

The compounds, including their salts, may also be obtained in the form of hydrates, or their crystals may, e.g., include the solvent used for crystallization. Different crystalline forms may be present.

The invention relates also to those forms of the process in which a compound obtainable as intermediate at any stage of the process is used as starting material and the remaining process steps are carried out, or in which a starting material is formed under the reaction conditions or is used in the form of a derivative, e.g., in protected form or in the form of a salt, or a compound obtainable by the process according to the invention is produced under the process conditions and processed further *in situ*. In the process of the present invention those starting materials are preferably used which result in new compounds of formula (I) described at the beginning as being especially valuable. Special preference is given to reaction conditions that are analogous to those mentioned in the examples.

The present invention also relates to pro-drugs of a compound of formula (I) that convert *in vivo* to the compound of formula (I) as such. Any reference to a compound of formula (I) is therefore to be understood as referring also to the corresponding pro-drugs of the compound of formula (I), as appropriate and expedient. The pharmacologically acceptable compounds

The invention relates also to a pharmaceutical composition that is suitable for administration to a warm-blooded animal, especially a human (or to cells or cell lines derived from a warm-blooded animal, especially a human, e.g., lymphocytes), for the treatment or, in a broader aspect of the invention, prevention of (= prophylaxis against) a disease that responds to inhibition of protein kinase activity, comprising an amount of a compound of formula (I) or a pharmaceutically acceptable salt thereof, which is effective for said inhibition, especially the in, together with at least one pharmaceutically acceptable carrier.

The pharmaceutical compositions according to the invention are those for enteral, such as nasal; rectal or oral; or parenteral, such as intramuscular or intravenous, administration to warm-blooded animals (especially a human), that comprise an effective dose of the pharmacologically active ingredient, alone or together with a significant amount of a pharmaceutically acceptable carrier. The dose of the active ingredient depends on the species of warm-blooded animal, the body weight, the age and the individual condition, individual pharmacokinetic data, the disease to be treated and the mode of administration.

The invention relates also to a method of treatment for a disease that responds to inhibition of a protein kinase, which comprises administering an (against the mentioned disease) prophylactically or especially therapeutically effective amount of a compound of formula (I) according to the invention, especially to a warm-blooded animal, e.g., a human, that, on account of one of the mentioned diseases, requires such treatment.

The dose of a compound of the formula (I) or a pharmaceutically acceptable salt thereof to be administered to warm-blooded animals, e.g., humans of approximately 70 kg body weight, is preferably from approximately 3 mg to approximately 10 g, more preferably from approximately 10 mg to approximately 1.5 g, most preferably from about 100 mg to about 1000 mg/person/day, divided preferably into 1-3 single doses which may, e.g., be of the same size. Usually, children receive half of the adult dose.

The pharmaceutical compositions comprise from approximately 1% to approximately 95%, preferably from approximately 20% to approximately 90%, active ingredient. Pharmaceutical

There may be mentioned as such especially liquid fatty acid esters that contain as the acid component a long-chained fatty acid having from 8-22 carbon atoms, especially from 12-22 carbon atoms, e.g., lauric acid, tridecylic acid, myristic acid, pentadecylic acid, palmitic acid, margaric acid, stearic acid, arachidic acid, behenic acid or corresponding unsaturated acids, e.g., oleic acid, elaidic acid, erucic acid, brasidic acid or linoleic acid, if desired with the addition of antioxidants, e.g., vitamin E,  $\beta$ -carotene or 3,5-di-*tert*-butyl-4-hydroxytoluene. The alcohol component of those fatty acid esters has a maximum of 6 carbon atoms and is a mono- or poly-hydroxy, e.g., a mono-, di- or tri-hydroxy; alcohol, e.g., methanol, ethanol, propanol, butanol or pentanol; or the isomers thereof, but especially glycol and glycerol. The following examples of fatty acid esters are therefore to be mentioned: ethyl oleate, isopropyl myristate, isopropyl palmitate, "Labrafil M 2375" (polyoxyethylene glycerol trioleate, Gattefossé, Paris), "Miglyol 812" (triglyceride of saturated fatty acids with a chain length of C<sub>8</sub>-C<sub>12</sub>, Hüls AG, Germany), but especially vegetable oils, such as cottonseed oil, almond oil, olive oil, castor oil, sesame oil, soybean oil and more especially groundnut oil.

The injection compositions are prepared in customary manner under sterile conditions; the same applies also to introducing the compositions into ampoules or vials and sealing the containers.

Pharmaceutical compositions for oral administration can be obtained by combining the active ingredient with solid carriers, if desired granulating a resulting mixture, and processing the mixture, if desired or necessary, after the addition of appropriate excipients, into tablets, dragée cores or capsules. It is also possible for them to be incorporated into plastics carriers that allow the active ingredients to diffuse or be released in measured amounts.

Excipients are especially flow conditioners and lubricants, e.g., silicic acid, talc, stearic acid or salts thereof, such as magnesium or calcium stearate; and/or polyethylene glycol. Dragée cores are provided with suitable, optionally enteric, coatings, there being used, *inter alia*, concentrated sugar solutions which may comprise gum arabic, talc, polyvinylpyrrolidone, polyethylene glycol and/or titanium dioxide; or coating solutions in suitable organic solvents, or, for the preparation of enteric coatings, solutions of suitable cellulose preparations, such as ethylcellulose phthalate or hydroxypropylmethylcellulose phthalate. Capsules are dry-filled capsules made of gelatin and soft sealed capsules made of gelatin and a plasticizer, such as glycerol or sorbitol. The dry-filled capsules may comprise the active ingredient in the form of granules, e.g., with fillers, such as lactose; binders, such as starches; and/or glidants, such as talc or magnesium stearate; and if desired with stabilizers. In soft capsules the active ingredient is preferably dissolved or suspended in suitable oily excipients, such as fatty oils, paraffin oil or liquid polyethylene glycols, it being possible also for stabilizers and/or antibacterial agents to be added. Dyes or pigments may be added to the tablets or dragée coatings or the capsule casings, e.g., for identification purposes or to indicate different doses of active ingredient.
